Adhoc stocktaking

This form of stocktaking refers to a specific correction of inventory, which is obviously wrong. Example:

- The system tells you there is no stock at a certain position, but there is stock at this position.

> It is bad practise to use this function is a regular pattern. Typically you should rather use rolling or regualr stocktaking to make sure that your inventory is correct.

Adhoc stocktaking is a mini regular stocktaking job, which focuses just one stock shelve or even only one content set in a stock shelve
