

# Delivery option set

Delivery option sets have the purpose to:

- make assignment of delivery options to [shopping purposes](#) easier
- make distribution of delivery options to third parties (see [b-op trade sphere core connector](#))

Delivery option sets are not distributed to other digitals themselves, but only the delivery options themselves. The options just make it easier to keep overview on them.

During shopping purpose definition, the option can filter within the delivery option set by [Delivery Option Types](#). This allows to reuse a delivery option set and filter per shopping purpose, which option types are made available. This is enabled by enabling the generally desirable delivery option types: Postal, Internal Pickup, External Pickup, Co-Mail
