MediaWiki:Apihelp-main-param-origin

When accessing the API using a cross-domain AJAX request (CORS), set this to the originating domain. This must be included in any pre-flight request, and therefore must be part of the request URI (not the POST body).

For authenticated requests, this must match one of the origins in the `Origin` header exactly, so it has to be set to something like `https://en.wikipedia.org` or `https://meta.wikimedia.org`. If this parameter does not match the `Origin` header, a 403 response will be returned. If this parameter matches the `Origin` header and the origin is allowed, the `Access-Control-Allow-Origin` and `Access-Control-Allow-Credentials` headers will be set.

For non-authenticated requests, specify the value *. This will cause the `Access-Control-Allow-Origin` header to be set, but `Access-Control-Allow-Credentials` will be `false` and all user-specific data will be restricted.
