Service Bundle

A service bundle is a service deployment grouping entity, which can bear one or multiple services and other service bundles. By this a deployment hierarchy can be built.

Main benefit for for the [b-op digital](#) or its maintaining users is, that they do not have to install services one-by-one. Also it makes it easier for all parties to maintain an overview with products having a large list of contained service.

A service bundle typically consists of b-op services which are closely connected or have a hard dependency. This is a part of the [b-op](#) concept to which ZUGSEIL is committet. Please check for details on the [b-op website](#).
